Field labor log

Record one person's time by crop and task, then total the minutes.

Week beginning _____ **Crew member or initials** _____

1 Record each work block

Use a new row when the crop or task changes. Check +1 only if the end is the next day.
In Exclude, write only minutes you intend to leave out. Use 24-hour clock times.

Date	Crop / plot	Task	Start	End	+1 day	Exclude min	Net min

2 Total one crop or task at a time

Add its net minutes before rounding. Divide that total by 60 to get decimal hours.

Crop, plot or task being totaled	Net minutes summed	Decimal hours

For work notes. Use a separate sheet for each person; overlapping rows double-count minutes.

From clock to crop

One grower, three work blocks. All times below are fictional.

1 Read the field notes

Day	Crop	Task	Start	End	+1 day	Exclude min	Net min
Mon	Kale	Harvest	06:15	09:00	No	0	165
Mon	Carrots	Wash	10:00	11:20	No	0	80
Tue	Kale	Pack	20:30	01:15	Yes	15	270

2 Split the overnight interval at midnight

Tuesday 20:30 to midnight is 210 minutes. Midnight to Wednesday 01:15 is 75.

210 + 75 = 285 elapsed minutes

285 - 15 = 270 net minutes. Divide by 60: 4.50 hours for this packing block.

3 Total by crop

Kale: 165 harvest + 270 pack = 435 minutes **7.25 hours**

Carrots: 80 wash minutes **1.33 hours**

All three blocks: 515 minutes **8.58 hours**

One clock trap

Forty-five minutes is 0.75 hours, not 0.45. Keep minutes until the final total.
For repeated clock times around a clock change, verify actual elapsed time separately.

Take this further

Open the free shift calculator for one same-day or overnight block.

See EarnCheck on the US App Store for an optional personal shift record on iPhone.

Why track by task?
